

Description

The Energizer Station for Perpetual PITs is a unit designed specifically to “energize” or recharge the supercapacitor in a Perpetual PIT. Two PITs can be connected at the same time, and as well as charging them the Energizer is also capable of detecting faults in the connected PITs.

To “energize” a PIT, simply connect the Energizer cable to the charge point on the PIT. Once connected, press the button in the centre of the unit to begin the energizing process. If the corresponding LED illuminates and changes from flashing green to solid green, then your PIT is ready to use. If however the LED is alternating between a red and orange colour, then it has encountered a fault with the PIT and it should be returned to Pinpoint for diagnostic/repair. The Energizer will fully charge a PIT in under 30 seconds, but could be faster. If it takes any longer then the unit has likely encountered a fault with the PIT.

The Energizer Station is intended to sit on a desk or table near a mains power source and should be in an easily accessible area so that staff can conveniently energize their Perpetual PITs before their shift starts and after use.

Model No: 311
Power Source: 12V DC Power Connector
Size: Height 96.15mm x Length 176mm x Width 94.8mm
Weight: 639.7g
